

# HEMOABDOMEN

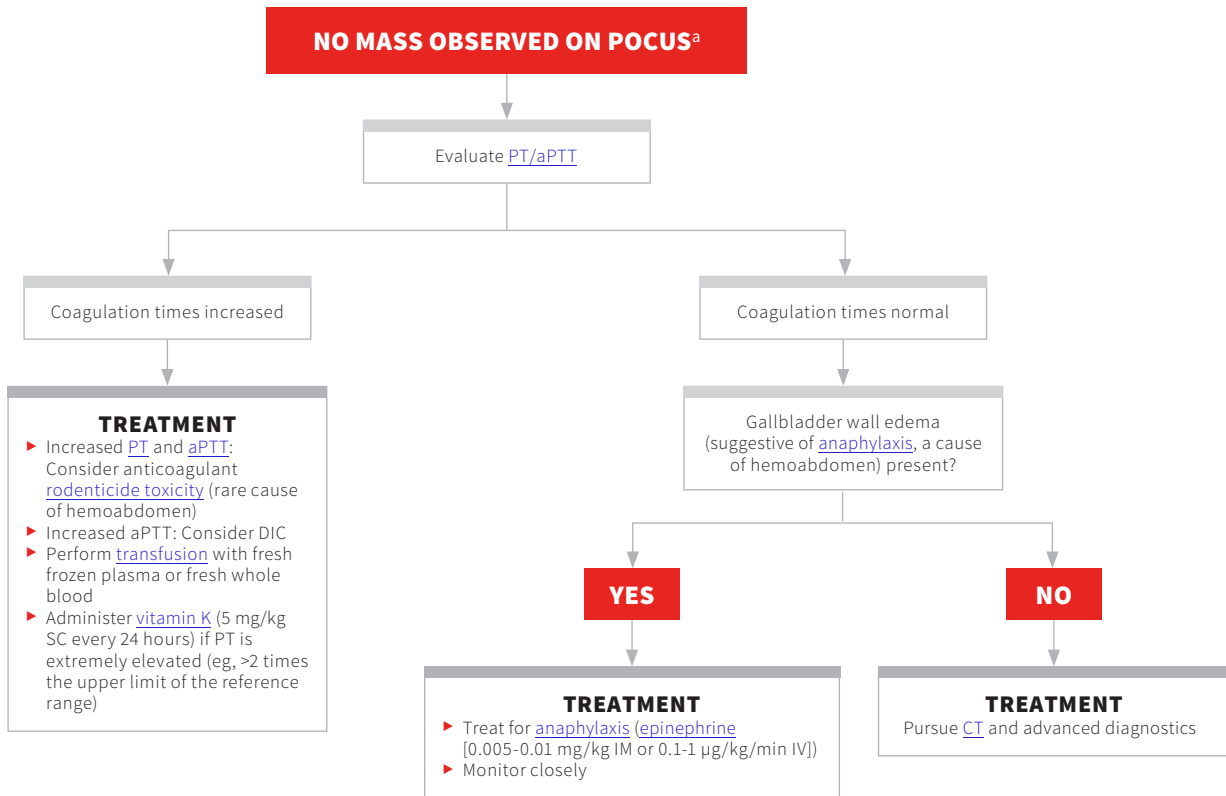

Elizabeth A. Rozanski, DVM, DACVIM (Small Animal), DACVECC

Sarah E. Cudney, DVM

Cummings School of Veterinary Medicine at Tufts University

<sup>a</sup>All stable hemoabdomen patients have the potential to decompensate. Heart rate, mucous membrane color, blood pressure, packed cell volume/total solids, mentation, pulse quality, and capillary refill time should be closely monitored.

ACA = aminocaproic acid  
 aPTT = activated partial thromboplastin time  
 DIC = disseminated intravascular coagulation  
 PCV = packed cell volume  
 POCUS<sup>a</sup> = point-of-care ultrasonography (abdomen)  
 PT = prothrombin time  
 VCM = viscoelastic coagulation monitoring
